MAJOR MUNICIPAL SOURCES

APPENDIX C

MAJOR MUNICIPAL DISCHARGERS

For each of the major municipal dischargers the following information is provided:

- ID NO. - EPA Identification number.
- FACILITY - the name of the municipal facility.
- POP SERVED - the population which discharges through the municipal facility.
- DESIGN FLOW (MGD) - the volume of waste which the facility was designed to process (millions of gallons per day).
- ACTUAL FLOW (MGD) - the volume of waste which the facility currently receives (millions of gallons per day).
- TYPE TREATMENT - the level of treatment which the facility currently provides.
- BOD INFLUENT (mg/l) - the average concentration of the BOD waste load which the facility receives.
- BOD EFFLUENT (mg/l) - the average concentration of the BOD waste load which the facility discharges.
- PERCENT BOD REMOVED - the percentage of BOD which the facility removes from its incoming load.

RUN DATE: 74/02/21

STATE = AL

APPENDIX E

MAJOR INDUSTRIAL DISCHARGERS

For each of the major industrial dischargers the following information is provided:

- NAME - the principal name of the plant.
- ST - the abbreviation of the name of the state in which the plant is located.
- WATERBODY - the stream, lake or ocean into which the plant discharges. For plants discharging into more than one waterbody, only one is shown.
- PRINCIPAL PRODUCT - one of the principal products. For plants which produce more than one product, only one is shown.
- FLOW - the total volume of waste water which the plant discharges to surface water (millions of gallons per day).
- PRINCIPAL POLLUTANTS - five pollutant parameters were selected to indicate the quality and magnitude of the discharge from major plants. Each pollutant load is expressed in pounds per day.
    - BOD - the five day biochemical oxygen demand.
    - NITROGEN - ammonia + nitrate (as nitrogen)
    - PHOSPHORUS - total phosphorus
    - TOTAL SOLIDS - total dissolved solids + suspended solids
    - METALS - antimony + arsenic + cadmium + chromium + cobalt + copper + iron + lead + manganese + mercury + nickel + silver + thallium + tin + zinc + molybdenum

APPENDIX G

SEGMENT GAZETTEER

G. SEGMENT GAZETTEER

This appendix displays information for individual waterway segments provided to EPA by States in their Section 106 program submissions for fiscal year 1974.

The data shown from left to right are:

- EPA region (01 through 10)
- State or territory (abbreviation)
- Basin code (two-digit number)
- Segment code (two-digit number)
- Segment classification: E (effluent-limited) or W (water quality-limited)
- Description of segment (or basin or State name)
- Water quality status--date of expected water quality goal achievement and brief explanatory notes where needed.

APPENDIX H

REFERENCE LEVEL RANKINGS

The reach rankings in Chapter II were derived by the procedure described in this appendix. This procedure is the only one of several tried which produces rankings that do not vary with seasonal groupings of the data.

Reference levels were established for 25 parameters, and good water reference levels for 14 of the 25. Parameters and levels were taken without modification from references existing in the literature to various critical parameters and levels. Some parameters measure the same pollutant using differing techniques.

The reference levels are compared, by parameter, with the mean median concentration on each reach. If a mean median for a parameter on a reach is better than that parameter's good water reference level, the parameter is said to be exemplary on the reach. If the mean median is worse than the reference level, the parameter is said to be exceptional on the reach. The levels selected represent the best available quantitative criteria, either from EPA guidelines, or from research activities. They are not intended to replace legally adopted local water quality standards. Table H-1 displays the reference levels and Table H-2 displays the good water reference levels and their sources.

Table H-3 displays the status - exemplary, exceptional, also measured, not measured - on each reach of the parameters associated with both sets of reference levels.

The reaches were then ordered by increasing number of exceptional parameters, and by decreasing number of exemplary parameters within groups of reaches with the same number of exceptional parameters.

This procedure yields the ranking given in Chapter II, reproduced in Table H-4 along with the number of parameters exemplary and exceptional on each reach.
